DIGII BRO — FREE CREATOR TOOLS

Hinglish Caption Tool
User Guide

Turn any voiceover into animated, viral-style Hinglish captions — the same captions you see on trending reels — in minutes, right inside your browser.

100% FREE | NO SIGN-UP | NO API KEY | WORKS IN CHROME

What This Tool Does

You give the tool your **final voiceover** (and, if you have it, an **SRT subtitle file**). It creates a **caption video** — animated Hinglish (Roman Urdu/Hindi) captions with small words, HUGE bold words and one highlighted keyword — on a green screen or a fully transparent background. You then place that caption video over your own video in CapCut, and you are done.

Your privacy: everything runs 100% inside your browser. Your audio never gets uploaded anywhere.

What You Need

- A computer or laptop with the **Google Chrome** browser (recommended for export).
- Your final voiceover file (MP3 / WAV / M4A).
- **Optional but best:** an SRT file of the same voiceover (for example, downloaded from ElevenLabs). This gives perfect, millisecond-accurate timing.
- Internet — only for the first time, so the free AI transcription model can download once. After that it stays saved in your browser.

Fastest Way — With an SRT File (Recommended)

1. 1 **Upload your voiceover** in Step 1 (drag & drop, or click to choose).
2. 2 In **Step 2 (Fastest Way)**, click **Choose SRT File** and select your SRT. The captions build and sync automatically — no waiting.
3. 3 In **Step 3**, pick a caption style you like and press **Sync Captions**.
4. 4 Press **Play Preview** to check, then in **Step 4** click **Export Caption Video**. Done!

Second Way — Automatic Transcription (Free)

1. Upload your voiceover in Step 1.
2. In **Step 2 (Second Way)**, keep the model on **Better — Whisper Base** and the language on **Hindi** (Hinglish conversion works best with Hindi).
3. Click **Transcribe** and wait — a 1.5-minute voiceover usually takes about 2–3 minutes (the very first time is slower because the model downloads once).

4. Read the transcript and fix any wrong words directly in the box — the tool auto-converts the text to Hinglish (Roman). You can also paste or type your own script.
5. Continue with Step 3 below.

> **Tip:** For word-perfect timing after transcribing, use the **Voice Sync** button — it listens to your actual audio and aligns every word to the exact moment it is spoken.

Step 3 — Style & Settings

- **Caption Styles (34):** click any style card to preview it instantly. Styles include Reference, Hormozi, MrBeast-style, serif, karaoke and more — pick the one that matches your video's mood.
- **Video format:** choose 9:16 (1080×1920) for Reels/TikTok/Shorts, or 16:9 (1920×1080) for YouTube landscape videos.
- **Background: Green Screen** (remove it later in CapCut with Chroma Key) or **Transparent** (no keying needed — the exported WebM has real transparency).
- **Words per caption:** keep **Auto** for natural phrases, or set fewer words for a punchier look.
- **Motion / Animation:** how the words enter — Viral Soft is a safe all-rounder.
- **Caption position & text size:** keep captions away from your face and from the app's own buttons (bottom area on Reels).
- **Sync offset:** if ALL captions are equally a little early or late, nudge with the −0.1s / +0.1s buttons or the slider.
- **Snap Words to Voice Pauses:** makes caption cuts land on natural pauses in your voice.

> **Pro trick:** wrap any word in double stars in the transcript — like `**FREE**` — and that word will always appear as the BIG highlighted keyword.

Step 4 — Export

1. Choose **Full HD** quality (or Fast 720p for a quicker, lighter file).
2. Click **Export Caption Video**. Export runs in real time — a 1-minute voiceover takes about 1 minute. **Do not close the tab while exporting.**
3. You will get an **MP4** (newer Chrome) or **WebM** file. With the Transparent background the file is always a transparent WebM.
4. You can also click **Also Download SRT Subtitle File** if you need a plain subtitle file.

Using Your Captions in CapCut

1. Edit your main video in CapCut the way you normally do.
2. Tap **Overlay** → **Add Overlay** and place the caption video on the layer above your video.
3. **Green screen only:** select the caption video → **Cutout** → **Chroma Key** → pick the green colour → raise the **Intensity** until the green disappears and only the captions remain. (Transparent exports: skip this step completely.)
4. If the timing is slightly off, slide the overlay a little forward or back.
5. Export your final video from CapCut as usual.

Troubleshooting

Problem	Fix
First transcription is very slow	Normal — the AI model downloads only once (about 2–5 minutes). Later uses are fast because it stays cached in your browser.
Captions are early/late everywhere	Use the **Sync offset** buttons in the Voice Sync section, or run **Voice Sync** for exact per-word timing.
A few words are wrong	Edit them directly in the transcript box, then press **Sync Captions** again.
Export failed or stuck	Use the Chrome browser, keep the tab open and visible during export, and try the Fast 720p quality.
Captions look too big/small	Adjust **Text size** in Step 3 and check the preview before exporting.
Green edges remain in CapCut	Raise the Chroma Key intensity a little more — or export from the tool with the **Transparent** background instead.

One honest note: transcription accuracy depends on how clear the voiceover is. Studio-clear audio (like ElevenLabs voices) gives near-perfect results; noisy recordings may need a few manual fixes in the transcript box.
